Definitions:

Immediately Dangerous (ID) appliances/installations

An ID appliance/installation is one which is an immediate danger to life or property. In general these will be RIDDOR reportable.

Broadly, these will be appliances/installations that fail tightness tests, appliances that fail spillage tests or appliances which have serious flueing and/or ventilation and/or combustion deficiencies.

At Risk (AR) appliances/installations

An AR appliance/installation is one which is potentially dangerous i.e. where one or more faults exist and which, as a result, **may in the future constitute a danger** to life or property. In general, the appliance/installation should be turned off with the responsible person's permission to make the situation safe and a 'Danger Do Not Use' label attached.

However, there are some exceptions where turning off the appliance/installation will not make the situation safer and must be referred to a responsible person/organisation for resolution e.g. built over PE gas service pipes and LPG bulk storage vessels incorrectly sited. These exceptions do NOT require a 'Danger Do Not Use' label to be attached.
